### Summary

#### What is already known about this topic?

The U.S. economic cost of opioid use disorder (\$471 billion) and fatal opioid overdose (\$550 billion) during 2017 totaled \$1,021 billion.

#### What is added by this report?

In the 39 jurisdictions studied, combined costs of opioid use disorder and fatal opioid overdose varied from \$985 million in Wyoming to \$72,583 million in Ohio. Per capita combined costs varied from \$1,204 in Hawaii to \$7,247 in West Virginia. States with high per capita combined costs were located mainly in the Ohio Valley and New England.

#### What are the implications for public health practice?

Federal and state public health agencies can use these data to help guide decisions regarding research, prevention and response activities, and resource allocation.

# Controlled Substance Peer Review

- Goal: *To apply standards for the safe prescribing of controlled substances throughout the MetroHealth system by reviewing prescribing practices of providers, providing feedback and recommendations for improvement in a confidential and collegial environment thereby reducing adverse patient outcomes and reducing the number of prescriptions for controlled substances.*

## Data Analyses Surface Ongoing Educational Opportunities

### Chart Reviews Enable More Targeted Coaching and Support

Even with multiple supports in place, some prescribers will still deviate from care standards. While their prescribing decisions may be appropriate, it is important to review their practice to ensure patient safety and care quality. MetroHealth created a multidisciplinary controlled substance peer review committee to promote safe opioid prescribing and adherence to the system's standards. The committee includes physician representation from physical medicine and rehab, primary care, psychiatry, emergency medicine, and anesthesia, and will also include a utilization review nurse in the future. The team analyzes outpatient prescribing data and patient charts to identify outlying prescribing patterns and meets one-on-one with prescribers as needed to set goals to modify opioid prescribing.

#### Controlled Substance Peer Review Committee

*Goal: Apply standards for the safe prescribing of controlled substances throughout the system, thereby reducing adverse patient outcomes and the number of prescriptions for controlled substances*

#### 1 Analyze Outpatient Prescriptions to Identify Outlying Prescribing Patterns

- Aggregate and analyze outpatient opioid prescribing data based on total pills prescribed, total pills per 100 encounters, and average MME over a two-year period for Schedule II and III opioids
- Identify outlying opioid prescribing patterns warranting further review

#### 2 Review Subset of Patients to Surface Root Causes

- Conduct an in-depth chart review of 10 patients receiving either a high rate or high dosage of opioids to determine if prescribing meets best practice standards
- Review chart for: diagnosis, reason for opioid prescription, OARRS<sup>1</sup> (Ohio state PDMP) utilization, toxicology screens, co-prescribing of benzodiazepines, frequency of office visits, ED visits for overdoses, frequent phone calls for refill requests, any other red flags

#### 3 Meet with Provider to Share Data and Set Goals

- If necessary, meet with providers to share data about their prescribing history in relation to their peers and the institution as a whole
- Provide and review checklist to set specific goals to improve overall safe opioid prescribing practices and determine actions to take with high-risk patients

#### Case in Brief: MetroHealth

- 731-bed, nonprofit integrated health system based in Cleveland, Ohio
- Controlled substance peer review committee analyzes outpatient opioid prescribing data to identify outlying opioid prescribing patterns
- To validate whether prescribing meets best practice, committee performs a chart review of 10 of the provider's patients
- Committee meets with prescribers individually if necessary to address any concerns and devise an action plan to appropriately treat patients at high-risk of opioid misuse

Review and summarize	Review and summarize prescribing data and overdose fatality data from Med examiner
Review	Review 10 patient charts utilizing advocate check list
Summarize	Summarize findings and present to peer review committee
Determine	Determine level of intervention: <ul style="list-style-type: none"><li>• Letter</li><li>• In person meeting</li></ul>
Review	Review ongoing basis for progress
Meet	Meet with provider to share data, get feedback, provide resources and set goals

# Advocate Check List

Provider:

Patient Name/MRN:

Age:

Gender:

Pertinent PMH:

Prescribed opioid regimen:

Opioid Dx:

1. Did provider document that an OARRS check was done and provide a summary of the results?
2. Are opioids co-prescribed with benzodiazepines, sedatives other controlled substances?
3. Is naloxone co- prescribed when appropriate (MME>50, high risk medication combinations or co-morbidities or with a h/o illicit drug use?)
4. Is there an opioid risk tool score (ORT) documented by this provider?

If not, does this patient have a documented?

- i. Psychiatric history
  - ii. Personal history of drug or alcohol abuse
  - iii. Family history of alcohol or drug abuse
  - iv. Documented history of child sexual abuse
5. Does the patient have a narcotic care plan (if name is highlighted in RED, click on the name to read care plan)
  6. What is a typical MED or morphine equivalent dose for the prescriptions provided by the provider? (
  7. Do you identify any encounters in EPIC for lost prescriptions, drug misuse, drug abuse, overdose or any other clues that aberrant behavior is going on with the patient?
  8. Is a patient contract documented for chronic pain management patients?
  9. Does physician documentation justify initial and ongoing appropriateness of controlled substances? (e.g other therapies tried and exhausted, medical condition is appropriate to be treated with controlled substance and efforts to wean opioid )
  10. Are pain management panels sent at routine appropriate intervals?
    - a. Are appropriate changes in management made when pain management panels are either positive for illicit substances or are negative for the medication being prescribed (may be an indicator that patient is selling the drug rather than using it personally)?
  11. Are patients being seen at regular intervals with provider in the office (at least every 6 months)?

Academic Detailing

# WHAT IS ACADEMIC DETAILING?

Academic detailing is **outreach education for health care professionals**. It uses the communication approach of pharmaceutical detailers, combined with the evidence-based, non-commercial aims of academic groups, and research centers.

The term “academic detailing” reflects this hybrid concept.

# ACADEMIC DETAILING FAQS

- University or non-commercial-based educational outreach
- No financial links to the pharmaceutical industry
- Face-to-face education of prescribers by trained health care professionals, typically pharmacists, physicians, or nurses
- Goal: improve prescribing of targeted drugs to be consistent with medical evidence from randomized controlled trials, which ultimately improves patient care and can reduce health care costs.

# MORE ACADEMIC DETAILING SUCCESS

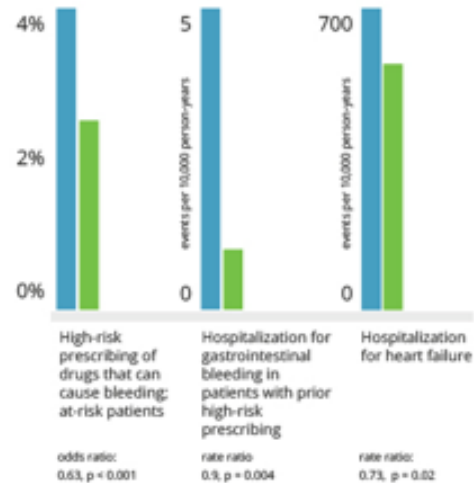

## OUTREACH EDUCATION THAT TRANSFORMS PATIENT CARE

**Academic detailing** takes the most rigorous university-based evidence review and delivers it interactively in the clinician's own office, to "market the evidence" rather than any product. **Decades of experience and scores of evaluation studies** prove that this approach transforms practice far more effectively than conventional continuing education lectures.

### A well-integrated program can prevent risky medication use as well

In a 2016 paper in the New England Journal of Medicine, a combination of academic detailing and data feedback reduced harmful combinations of drugs that can promote bleeding, as well as preventing the resulting hospitalizations.

■ before intervention  
■ after intervention

# EXAMPLES OF NALOXONE MATERIALS

## Accidental opioid overdose is preventable

The main risk of death from an opioid overdose is prior overdose. A patient who has previously overdosed is 6 times more likely to overdose in the subsequent year.<sup>1</sup>

### OTHER FACTORS THAT INCREASE RISK OF OVERDOSE:

>> The majority of opioid overdose deaths involve at least one other drug, including benzodiazepines, cocaine or alcohol.<sup>4</sup>

FIGURE 3. OVERDOSE MORTALITY RATES BY WEEK SINCE PRISON RELEASE  
An example of overdose risk if opioids are discontinued and restarted<sup>5</sup>

When a patient reduces or stops opioid use, there is an increased risk of overdose death if opioid use increases again.

## Naloxone is effective

FIGURE 5. FATAL OPIOID OVERDOSE RATES BY NALOXONE IMPLEMENTATION IN MASSACHUSETTS<sup>6</sup>

<sup>6</sup> Adapted from Ralston (2015) adjusted for population age, sex, race/ethnicity, below poverty level, Medicaid enrollment, opioid addiction, methadone and buprenorphine treatment, prescriptions for death, diagnosis, and

## ...and cost-effective<sup>8</sup>

A manuscript in the *Annals of Internal Medicine* indicated that providing naloxone to heroin users is robustly cost-effective and possibly cost-saving. Investigators believe similar results apply to other opioid users.

### Cost:

### Benefit:

Emerging data suggests that providing naloxone may encourage patients to be safer with their opioid use. If this is the case, the intervention would be cost-saving and 24 prescriptions would prevent one death.

## Indications for naloxone prescription

### CONSIDER OFFERING A NALOXONE PRESCRIPTION TO:

- All patients prescribed long-term opioids
- Anyone otherwise at risk of experiencing or witnessing an opioid overdose

### WHY PRESCRIBE TO ALL PATIENTS ON LONG-TERM OPIOIDS?

It is difficult to predict which patients who take prescription opioids are at risk for overdose.

Many patients do not feel they are at risk for overdose. Prescribing to all patients on opioids will help patients understand naloxone is being prescribed for risky drugs, not risky patients.

About 40% of overdose deaths result from diverted medications.<sup>9</sup> Whether intentional or unintentional, diverted opioids are a serious risk. Co-prescribing naloxone increases the chance that the antibiotic will remain with the medication.

## Potential behavioral impact

### Being offered a naloxone prescription may lead to safer opioid use.

U.S. Army base Fort Bragg in North Carolina averaged 8 overdoses per month. After initiating naloxone distribution, the overdose rate dropped to zero—with no reported naloxone use.<sup>10</sup>

"[When I prescribe naloxone, there's that realization of how important this is and how serious this is to their eyes." —Dr. Amy Fortnag, primary care provider

### Selected San Francisco Health Network clinics began co-prescribing naloxone to patients on opioids in 2013.

"I had never really thought about [overdose] before. It was more so an eye opener for me to just look at my medications and actually start reading [about] the side effects, you know, and how long should I take them. I looked at different options, especially at my age." —San Francisco patient<sup>11</sup>

### Offering a naloxone prescription can increase communication, trust and openness between patients and providers.

"By being able to offer something concrete to protect patients from the danger of overdose, I am given an opening to discuss the potential harms of opioids in a non-judgmental way." —San Francisco primary care provider<sup>12</sup>

# Academic Detailing Flow at MetroHealth

- One -on -one visits to be scheduled for 10-15 min with providers
- Ideally, visits are in – person at clinicians office to easily integrate into their schedule
- During COVID pandemic, visits will be virtual with video
- (Brief) Pre and post assessment of need will be conducted
- Typically, at least 2 visits will be scheduled
- Depending on need, may provide more visits

# SUMMARY

Support from leadership is vital

Data guides interventions

Interventions should be evidence based

Pharmacists should be involved in planning and leading efforts

Continuous monitoring for quality and improvement
